Is your business ready? Every Angle can ensure your SAP system is healthy and ready to upgrade.

SAP is constantly pushing its customers to upgrade, to use more of its technology, invest more in the software. One example is the push to S/4 HANA. However, is your business ready? Is your data clean? Are your processes robust and being followed? Not sure? We can help you find out – and sort them out!

Introduction
After the dust has settled from an SAP implementation many businesses find that expected improvements have not materialised to the extent that was expected. The advantages of integrating all data into one integrated business system can be jeopardized by incorrectly maintained master data and polluted or simply incorrect transactional data. This has a negative impact on the systems ability to support effective process management, planning, reporting and decision making. Furthermore, processes are often not executed as they were intended. Frustrated by the discipline needed to maintain SAP, users often search for workarounds and download data to process outside of SAP.

This situation can rapidly escalate as a result of the acceleration of business processes, after a switch to the HANA memory technology.

In addition, trends such as Industry 4.0 and IoT are poised to dramatically increase the complexity of data feeds - machine data, social media data, geo data – all processed and integrated into the existing ERP processes. This results in significantly higher data complexity. Are you ready for Big Data if your small data is out of control?

Objective
Every Angle is a software solution that fully understands SAP’s complex data structures, and is used to provide real insights into the workings of your business at a level that enable people to take actions. We are able to use our technology and experience to ensure that your current SAP system is robust and ready for the move to S/4 HANA.

We can demonstrate within a week how well your SAP system is used, the integrity of the master and transactional data and how effective the value chain’s operational processes are performing.

Use
1. Transparency through fact-based analysis of:
   - Data contamination in master data and movement Efficiency of operational processes (bottlenecks, data contamination, residues)
   - Insights into exceptions in your SAP data and processes
   - Root causes analysis: Why do the problems occur? What effect do they have? How much did they cost us?

2. Action catalog for preparation for SAP S/4HANA

Scope and process
The scope covers the entire value chain, including master data.
- Purchasing (Procure to Pay)
- Production
- Maintenance
- Inventory Management
- Management Sales (Order to Cash)
- Financial Management (Finance to Report) Master Data Management
For each area a detailed analysis can be carried out.

The project is carried out in two phases:

Phase 1: Interviews to analyze the data base with the business process managers

Phase 2: Presentation of the results in a management workshop

The benefits of the SAP health-check does not stop after the identification of the problems. Every Angle shows potential improvements in data quality and business processes. In most cases, Every Angle can convert the improvement opportunities directly from your SAP system, into immediate fact-based actions and recommendations.

Results
Analysis of supply chain processes

During the functional SAP audit, the operational processes are analyzed in detail by taking into account the documents and data generated and processed in all SAP as well as their effect on the supply chain.

Analysis of the master data

Every Angle performs a data quality-oriented analysis on the master data and focuses on:

- ✔ Customer Master Data
- ✔ Supplier Master Data Material Master Data
- ✔ Info records and source lists Piece List
- ✔ Technical objects, such as equipment, serial numbers and functional locations
- ✔ Correctness, completeness and consistency

Analysis of stocks

Every Angle performs a current inventory analysis quantitatively and in terms of value, taking into account:

- ✔ Product life cycles - material status, deletion flag and planning status
- ✔ Availability of inventory
- ✔ Batch information - expiration data, shelf life and batch classification
- ✔ Historical consumption
- ✔ Planned consumption, based on all requirements in SAP, including forecast and safety stock
- ✔ Analysis of undesirable material movements, scrapping and corrections

Every Angle analyzes assigned, open purchase orders, planned orders, customer orders and production orders based on the current stock level and planned requirements.

In addition, Every Angle detects potentially oversupply orders that create future surplus stocks as well as under-scheduled orders that lead to warehouse bottlenecks, short-term rescheduling, and delayed customer shipments. A large number of bottlenecks can be detected and subsequently provided with a processing list.

Those who know more, act faster.

Every Angle
