

What's new in Every Angle 2011, SP5

In service pack 5 of Every Angle release 2011, the Every Angle system has been improved on 32 points. The most important changes are listed below.

New features for users

Now end-users can use so called "User calculated fields". They can create an additional field with just a few mouse clicks in a list overview. Business users can easily enter formulas to quickly calculate differences, sums, lead times, percentages or combined text-fields without the need to export the data to Excel.

A new tool is introduced in the Every Angle suite: The "Mini Automated Client". This tool can execute unattended tasks, like automatically saving an angle result to disc, or sending a mail to a group of users if an exceptional situation occurs.

The help texts and manual are made available in German, French and Spanish. In previous releases, these languages were only supported for the texts copied from SAP, like database fieldnames and help texts in the SAP system. Now, also the Every Angle special fields are translated as well as the user manual.

The product hierarchy of materials is now automatically analyzed, including the hierarchy descriptions of the different levels without the need for special configurations.

The performance of the refresh process is improved, because the component that pre-processes the SAP tables on the server is improved.

New features for system administrators

For system managers and configuration consultants two new functions are introduced: JOIN support in the Every Angle table splitter, and sub-lists that can be based on other sub-lists or relations.
